DECIBELS: A decibel (dB) is simply a measurement of how loud a noise is. Think of dB as the volume knob on your receiver. 50 dB is quiet while 140 dB is so loud it can immediately injure your ears. TRANSMISSION LOSS is a measurement of the dB (volume) difference on either side of a wall. Let's say we have a 100 dB tone on one side of a wall.

Parametric array. Since the early 1960s, researchers have been experimenting with creating directive low-frequency sound from nonlinear interaction of an aimed beam of ultrasound waves produced by a parametric array using heterodyning. Ultrasound has much shorter wavelengths than audible sound, so that it propagates in a much narrower beam than any normal loudspeaker system using audio frequencies.

The domain of spatial audio comprises methods for capturing, processing, and reproducing audio content that contains spatial information. Data-based methods are those that operate directly on the spatial information carried by audio signals. This is in contrast to model-based methods, which impose spatial information from, for example, metadata like the intended position of a source onto ...
