Field Oriented Control (FOC) is a method of motor control to generate three-phase sinusoidal signals which can easily be controlled in frequency and amplitude in order to minimize the current, which in turn means to maximize the efficiency. The basic idea is to transform three-phase signals into two rotor-fix signals and vice-versa.

Field-oriented control (FOC), or vector control, is a technique for variable frequency control of the stator in a three phase AC induction motor drive using two orthogonal components. One defines the magnetic flux generated by the stator, while the other corresponds to the torque as determined by the speed of the motor determined by the rotor position.
